Jasmine(Yu) Hao

Faculty of Business and Economics  
Hong Kong University

September 1, 2021

- ▷ Instructor: Dr.Yu Hao
- ▷ Email: haoyu@hku.hk
- ▷ Office: KK927
- ▷ Consultation times: Monday 10:00am – 11:00am
- ▷ Tutor: Ms. Karen Mai
- ▷ Email: maixt@hku.hk
- ▷ Consultation times: Thursday, TBA

- ▷ This course studies how practical problems can be solved by applying econometric methods.
- ▷ The emphasis is on the application of econometric methods to the analysis of real world economic data using R.
- ▷ Topics include multilinear regressions, limited dependent variable, panel data, experiments and quasi-experiments, instrumental variables, time series and forecasting, and basics of machine learning.
- ▷ Pre-requisites:
  - ◇ Solid knowledge of statistics
  - ◇ Introductory level econometric methods
  - ◇ Linear algebra

- ▶ Students are encouraged to check out student resources the publisher provides on Moodle.
- ▶ Lecture slides will be posted on the course website.
- ▶ Additional handouts will be distributed when needed to supplement the textbook.

## Main textbook:

- ▷ Stock, James and Mark Watson (2018), *Introduction to Econometrics*, Global Edition, 4th ed., Pearson. (It is perfectly fine if you use the 3rd edition of this textbook.)
- ▷ Hanck, Christoph, Martin Arnold, Alexander Gerber, and Martin Schmelzer. "Introduction to Econometrics with R." University of Duisburg-Essen (2019).

## Supplementary textbook:

- ▷ Jeffrey Wooldridge , *Introductory Econometrics: A Modern Approach*, Ohio : South-Western Cengage Learning.
- ▷ Bruce E. Hansen(2021) , *Introduction to Econometrics*.
- ▷ Cunningham, Scott. "Causal Inference." *The Mixtape 1* (2020).
- ▷ Sheppard, Kevin. "Introduction to Python for econometrics, statistics and data analysis." *Self-published, University of Oxford, version 2* (2012).

- ▷ 6 Assignments in total, distributed every Saturday
  - ◇ Group work with group of maximum 5 students
  - ◇ Graded based on the best 5 assignments
  - ◇ Need to submit coding exercises, R notebook is recommended.  
(Karen will help with setting up)
- ▷ Midterm on September 18th.
- ▷ Final (time and venue TBA)

- ▷ Week 1
  - ◇ Introduction: Evidence and Policy
  - ◇ Causality and Validity Probability and Statistical Theory Review (SW Ch. 2 -3)
  - ◇ Introduction to Programming Language
- ▷ Week 2
  - ◇ Bivariate Regression (SW Ch. 4 – 5)
  - ◇ Multivariate Regression I & II (SW Ch. 6 - 7)
- ▷ Week 3
  - ◇ Nonlinear Regression models: Quadratic and Logarithms (SW, Ch. 8)
  - ◇ Threats to (Internal / External) Validity (SW, Ch. 9)
  - ◇ Midterm

- ▷ Week 4
  - ◇ Regressions with binary dependent variables (SW, Ch. 11)
  - ◇ Regressions with panel data (SW Ch. 10; Wooldridge Ch.13-14)
- ▷ Week 5
  - ◇ Instrumental variables methods (SW, Ch. 12; Wooldridge, Ch. 15)
  - ◇ Experiments and Quasi-Experiments (Chapter 13)
- ▷ Week 6
  - ◇ Times series regressions and forecasting (SW, Ch. 14)
  - ◇ Machine Learning (material will be distributed by instructors.)

# Review of Probability <sup>1</sup>

Jasmine(Yu) Hao

Faculty of Business and Economics  
Hong Kong University

September 1, 2021

---

<sup>1</sup>This section is based on Stock and Watson (2020), Chapter 2. 

- ▷ An **outcomes** is a specific result:
  - ◇ Coin toss: either  $H$  or  $T$ .
  - ◇ Roll of dice:  $1, 2, \dots, 6$ .
- ▷ The **probability** of an **outcome** is the proportion of the time that the outcome occurs in the long run.
  - ◇ Fair coin toss: 50 % chance of heads.
- ▷ The **sample space** is the set of all possible outcomes.
  - ◇ In a coin flip the sample space is  $S = \{H, T\}$ .
  - ◇ If two coins are flipped the sample space is  $S = \{HH, HT, TH, TT\}$ .
- ▷ An **event** is a subset of the sample space.
  - ◇ Roll a die  $A = \{1, 2\}$ .

# Probability Function

## Definition 1 (Probability Function)

A function  $\mathbb{P}$  which assigns a numerical value to events is called a probability function if it satisfies the following Axioms of Probability:

1.  $\mathbb{P}(A) \geq 0$ .
2.  $\mathbb{P}(S) = 1$ .
3. If  $A_1, A_2, \dots$  are disjoint then  $\mathbb{P}(\cup_{j=1}^N A_j) = \sum_{j=1}^N \mathbb{P}(A_j)$ .

# Conditional Probability

## Definition 2 (Conditional Probability)

If  $\mathbb{P}(B) > 0$ , then the **conditional probability** of  $A$  given  $B$  is given by

$$\mathbb{P}(A|B) = \frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)}.$$

$\mathbb{P}(B)$  is the **marginal probability** of event  $B$ .

$$\mathbb{P}(B) = \mathbb{P}(A \cap B) + \mathbb{P}(A^c \cap B).$$

Take two events  $H$  and  $M$ .

- ▷ let  $H$  be the event that an individual's monthly wage exceeds HKD 20000,
- ▷ let  $M$  be the event that the individual has a master's degree.

Table: Joint Distribution

	Master degree	Non-master degree	Any education
High wage	0.19	0.12	0.31
Low wage	0.17	0.52	0.69
Any wage	0.36	0.64	1.00

Distributions

References

The probability of earning a high wage conditional on high education is

$$\begin{aligned} & \mathbb{P}(\text{High wage} | \text{Master degree}) \\ &= \frac{\mathbb{P}(\text{High wage} \cap \text{Master degree})}{\mathbb{P}(\text{High wage} \cap \text{Master degree}) + \mathbb{P}(\text{Low wage} \cap \text{Master degree})} \\ &= \frac{0.19}{0.36} = 0.53. \end{aligned}$$

Similarly, the probability of earning a high wage conditional on non-master degree is

$$\mathbb{P}(\text{High wage} | \text{Non-master degree}) = \frac{0.12}{0.64} = 0.19.$$

# Independence

- ▶ The events  $A$  and  $B$  are independent if  $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$

Some facts:

- ▶ When events are independent then joint probabilities can be calculated by multiplying individual probabilities.
- ▶ If  $A$  and  $B$  are disjoint then they cannot be independent.

## Theorem 3 (Bayes Rule)

If  $\mathbb{P}(A) > 0$  and  $\mathbb{P}(B) > 0$  then

$$\mathbb{P}(A|B) = \frac{\mathbb{P}(B|A)\mathbb{P}(A)}{\mathbb{P}(B|A)\mathbb{P}(A) + \mathbb{P}(B|A^c)\mathbb{P}(A^c)}.$$

Consider the PCR test for Covid-19:

- ▷ If actual infected: 0.9 positive, 0.1 negative.
- ▷ If not infected: 0.05 positive, 0.95 negative.
- ▷ 1 % population is infected.

**What is the chance of being infected given the test is positive?**

Let  $A$  denote being infected, let  $B$  denote test result positive.

- ▷  $P(B|A) = 0.9$ ,  $P(B|A^c) = 0.05$ ,  $P(A) = 0.01$ .
- ▷  $P(A|B) = \frac{P(B|A)P(A)}{P(B|A)P(A)+P(B|A^c)P(A^c)} = \frac{0.9*0.01}{0.9*0.01+0.05*0.99} \approx 0.1538$ .

**What is the chance of not infected given the test is negative?**

- ▷  $P(A^c|B^c) = \frac{P(B^c|A^c)P(A^c)}{P(B^c|A)P(A)+P(B^c|A^c)P(A^c)} = \frac{0.95*0.99}{0.1*0.01+0.95*0.99} \approx 0.9989$ .

## Definition 4 (Random variable)

A random variable is a real-valued outcome; a function from the sample space  $S$  to the real line  $\mathbb{R}$ .

For example,  $X$  is a mapping from the coin flip sample space to the real line, with  $T$  mapped to 0 and  $H$  mapped to 1.

$$X = \begin{cases} 1 & \text{if } H \\ 0 & \text{if } T. \end{cases}$$

Properties of random variables.

- ▶ The **expected value** is the long-run average of the random variable.
- ▶ The **standard deviation** measures the spread of a probability distribution.

- ▶ The set  $\mathcal{X}$  is discrete if it has a **finite or countably infinite number of elements**.
- ▶ If there is a discrete set  $\mathcal{X}$  such that  $\mathbb{P}(X \in \mathcal{X}) = 1$  then  $X$  is a discrete random variable.
- ▶ The **probability mass function** of a random variable is  $\pi(x) = \mathbb{P}(X = x)$ , the probability that  $X$  equals the value  $x$ .
- ▶ The **probability distribution** of a discrete random variable is the list of all possible values of the variable and the probability that each value will occur.

For a discrete variable  $X$  with the support of  $\mathcal{X}$ , the expectation is computed as

$$\mathbb{E}(X) = \sum_{x \in \mathcal{X}} \pi(x)x.$$

- ▷  $X = 1$  with the probability of  $p$  and  $X = 0$  with probability  $1 - p$ . The expected value is  $\mathbb{E}(X) = 1 * p + 0 * (1 - p) = p$ .

The expectation of the function of  $X$ ,  $g(X)$  is computed as

$$\mathbb{E}(g(X)) = \sum_{x \in \mathcal{X}} \pi(x)g(x).$$

The **cumulative probability distribution (CDF)** is the probability that the random variable is less than or equal to a particular value,

$$F(x) = \mathbb{P}(X \leq x),$$

where the probability event is  $X \leq x$ .

**Properties of a CDF** If  $F(x)$  is a distribution function, then

1.  $F(x)$  is non-decreasing.
2.  $\lim_{x \rightarrow -\infty} F(x) = 0$ .
3.  $\lim_{x \rightarrow \infty} F(x) = 1$ .
4.  $F(x)$  is right-continuous,  $\lim_{x \downarrow x_0} F(x) = F(x_0)$ .

(c) Education

- ▷ The **probability density function**(*p.d.f*) area under the probability density function between any two points is the probability that the random variable falls between those two points.
  - ◇ the probability for a continuous variable to take any value is 0.
  - ◇ definition is different from discrete random variables.
- ▷ When  $F(x)$  is differentiable, the density function is  $f(x) = \frac{dF(x)}{dx}$ .

### Theorem 5 (Properties of density function)

A function  $f(x)$  is a density function if and only if

- ▷  $f(x) \geq 0 \forall x$ .
- ▷  $\int_0^{\infty} f(x)dx = 1$ .

## Example - Continuous Variables

Suppose  $X$  is a random variable (either discrete or continuous).

- ▷ The **mean** of  $X$  is  $\mu = \mathbb{E}(X)$ .
- ▷ The **variance** of  $X$  is  $\sigma^2 = \text{var}(X) = \mathbb{E}((X - \mathbb{E}(X))^2)$ .
  - ◇ The **standard deviation** of  $X$  is the positive root of the variance,  $\sigma = \sqrt{\sigma^2}$ .
- ▷ The  $m$ -th **moment** of  $X$  is  $\mu'_m = \mathbb{E}(X^m)$  and the  $m$ -th **central moment** of  $X$  is  $\mu_m = \mathbb{E}((X - \mathbb{E}(X))^m)$ .
  - ◇ The **skewness** of  $X$  is defined as  $\text{skewness} = \frac{\mathbb{E}((X - \mathbb{E}(X))^3)}{\sigma^3}$ . If the distribution is symmetric, the skewness is 0.
  - ◇ The **kurtosis** of  $X$  is defined as  $\text{skewness} = \frac{\mathbb{E}((X - \mathbb{E}(X))^4)}{\sigma^4}$ .

## Bivariate random variables

A pair of **bivariate random variables** is a pair of numerical outcomes; a function from the sample space to  $\mathbb{R}^2$ .

A pair of bivariate random variables are typically represented by a pair of uppercase Latin characters such as  $(X, Y)$ . Specific values will be written by a pair of lower case characters, e.g.  $(x, y)$ .

Figure: Tossing two coins

The **joint distribution function (Joint CDF)** of  $(X, Y)$  is defined as  $F(x, y) = \mathbb{P}(X \leq x, Y \leq y) = \mathbb{P}(\{X \leq x\} \cap \{Y \leq y\})$ .

- ▶ A pair of random variables is **discrete** if there is a discrete set  $(\mathcal{P}) \in \mathbb{R}^2$  such that  $\mathbb{P}((X, Y) \in \mathcal{P}) = 1$ .
  - ◊ The set  $\mathcal{P}$  is the support of  $(X, Y)$  and consists of a set of points in  $\mathbb{R}^2$ .
  - ◊ The **joint probability mass function** is defined as  $p(x, y) = \mathbb{P}(X = x, Y = y)$ .
- ▶ The pair  $(X, Y)$  has a continuous distribution if the joint distribution function  $F(x, y)$  is **continuous** in  $(x, y)$ .
  - ◊ When  $F(x, y)$  is continuous and differentiable its **joint density (joint PDF)**  $f(x, y)$  equals  $f(x, y) = \frac{\partial^2 F(x, y)}{\partial x \partial y}$ .

The **expected value** of real-valued  $g(X, Y)$  is

$$\mathbb{E}(g(X, Y)) = \sum_{(x,y) \in \mathbb{R}^2, \pi(x,y) > 0} g(x, y) \pi(x, y),$$

and

$$\mathbb{E}(g(X, Y)) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} g(x, y) f(x, y) dx dy.$$

The **marginal distribution(marginal CDF)** of  $X$  is

$$F_X(x) = \mathbb{P}(X \leq x) = \mathbb{P}(X \leq x, Y \leq \infty) = \lim_{y \rightarrow \infty} F(x, y).$$

▷ In the continuous case,

$$F_X(x) = \lim_{y \rightarrow \infty} \int_{-\infty}^y \int_{-\infty}^x f(u, v) du dv = \int_{-\infty}^{\infty} \int_{-\infty}^x f(u, v) du dv.$$

The **marginal densities(marginal PDF)** of  $X$  is the derivative of the marginal CDF of  $X$ ,

$$f_X(x) = \frac{d}{dx} F_X(x) = \frac{d}{dx} \int_{-\infty}^{\infty} \int_{-\infty}^x f(u, v) du dv = \int_{-\infty}^{\infty} f(x, y) dy.$$

The conditional cumulative distributions:

- ▶ The **conditional distribution function** of  $Y$  given  $X = x$  is

$$F_{Y|X}(y|x) = \mathbb{P}(Y \leq y | X = x)$$

for any  $x$  such that  $\mathbb{P}(X = x) > 0$ , If  $X$  has a discrete distribution.

- ▶ For continuous  $X, Y$ , the **conditional distribution** of  $Y$  given  $X = x$  is

$$F_{Y|X}(y|x) = \lim_{\epsilon \downarrow 0} \mathbb{P}(Y \leq y | x - \epsilon \leq X \leq x + \epsilon).$$

The conditional density:

- ▶ For continuous variable  $(X, Y)$ , the conditional density function (conditional PDF) is defined by  $f_{Y|X}(y|x) = \frac{d}{dy} F_{Y|X}(y|x)$ .

- ▶ Recall that two events  $A$  and  $B$  are independent if the probability that they both occur equals the product of their probabilities, thus  $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$ .
- ▶ Consider the events  $A = \{X \leq x\}$  and  $B = \{Y \leq y\}$ .
- ▶ The probability that they both occur is  $\mathbb{P}(A \cap B) = \mathbb{P}(X \leq x, Y \leq y) = F(x, y)$ .
- ▶ If  $F(x, y) = F_X(x)F_Y(y)$  then  $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$ .
- ▶ The random variables  $X$  and  $Y$  are **statistically independent** if for all  $x, y$ ,  $F(x, y) = F_X(x)F_Y(y)$ .
- ▶ If  $X, Y$  have differentiable density function,  $X, Y$  are statistically independent if  $f(x, y) = f_X(x)f_Y(y)$ .
- ▶ The discrete random variables  $X$  and  $Y$  are **statistically independent** if for all  $x, y$ ,  $\pi(x, y) = \pi_X(x)\pi_Y(y)$ .

- ▷ If  $X, Y$  are independent and continuously distributed, then

$$f_{Y|X}(y|x) = f(y),$$

$$f_{X|Y}(x|y) = f(x).$$

- ▷ If  $X$  and  $Y$  are independent then for any functions,  $g : \mathbb{R} \rightarrow \mathbb{R}$  and  $h : \mathbb{R} \rightarrow \mathbb{R}$  such that  $\mathbb{E}|g(X)| < \infty$  and  $\mathbb{E}|h(Y)| < \infty$ , then

$$\mathbb{E}(g(X)h(Y)) = \mathbb{E}_X(g(X))\mathbb{E}_Y(h(Y)).$$

- ▷ If  $X$  and  $Y$  have finite variances, the **covariance** between  $X$  and  $Y$  is

$$\text{cov}(X, Y) = \mathbb{E}((X - \mathbb{E}(X))(Y - \mathbb{E}(Y))) = \mathbb{E}(XY) - \mathbb{E}(X)\mathbb{E}(Y).$$

- ▷ The **correlation** between  $X$  and  $Y$  is

$$\text{corr}(X, Y) = \frac{\text{cov}(X, Y)}{\sqrt{\text{var}(X)\text{var}(Y)}}.$$

- ▷ If  $X$  and  $Y$  are independent with finite variances, then  $X$  and  $Y$  are uncorrelated.
  - ◊ The reverse is not true. For example, suppose that  $X \sim U[-1, 1]$ . Since it is symmetrically distributed about 0 we see that  $\mathbb{E}[X] = 0$  and  $\mathbb{E}[X^3] = 0$ . Set  $Y = X^2$ . Then  $\text{cov}(X, Y) = \mathbb{E}[X^3] - \mathbb{E}[X^2]\mathbb{E}[X] = 0$ . Thus  $X$  and  $Y$  are uncorrelated yet are fully dependent!
- ▷ If  $X$  and  $Y$  have finite variances,  
$$\text{var}(X + Y) = \text{var}(X) + \text{var}(Y) + 2\text{cov}(X, Y).$$
- ▷ If  $X$  and  $Y$  are independent,  $\text{var}(X + Y) = \text{var}(X) + \text{var}(Y)$ .

- ▷ Consider  $m(X) = \mathbb{E}[Y|X]$  a transformation of  $X$ .
- ▷ We can take expectation with respect to  $m(X)$

## Theorem 6 (Law of Iterated Expectations(LIE))

*If  $\mathbb{E}[Y] < \infty$ , then  $\mathbb{E}[\mathbb{E}[Y|X]] = \mathbb{E}[Y]$ .*

## Definition 7 (Standard Normal Dist.)

A random variable  $Z$  has the **standard normal distribution**, write  $Z \sim N(0, 1)$ , if it has the density

$$\phi(x) = \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{x^2}{2}\right), x \in \mathbb{R}.$$

Note the standard normal density is typically written as  $\phi(x)$ . The CDF does not have closed form but is written as  $\Phi(x)$ .  
If  $X \sim N(\mu, \sigma^2)$  and  $\sigma > 0$  then  $X$  has the density

$$f(x|\mu, \sigma^2) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right), x \in \mathbb{R}.$$

# Multivariate Normal I

Let  $Z_1, \dots, Z_m$  be i.i.d  $N(0, 1)$ . The joint density is the product of the marginal densities:

$$\begin{aligned} f(x_1, \dots, x_m) &= f(x_1) \dots f(x_m) \\ &= \frac{1}{(2\pi)^{m/2}} \exp\left(-\frac{1}{2} \sum_{i=1}^m x_i^2\right). \end{aligned}$$

## Multivariate Normal II

Let  $\mathbf{Z} = [Z_1, \dots, Z_m]^\top$  be an  $m$ -component random vector following standard normal distribution  $\mathbf{Z} \sim N(0, \mathbf{I}_m)$  and  $\mathbf{X} = \boldsymbol{\mu} + \mathbf{B}\mathbf{Z}$  for  $q \times m$  matrix  $\mathbf{B}$ , then  $\mathbf{X}$  has the **multivariate normal distribution**, written as  $\mathbf{X} \sim N(\boldsymbol{\mu}, \boldsymbol{\Sigma})$ , where  $\boldsymbol{\Sigma} = \mathbf{B}\mathbf{B}^\top$ .

The PDF of  $\mathbf{X}$  is given by

$$f(\mathbf{x}) = \frac{1}{(2\pi)^{q/2}(\det \boldsymbol{\Sigma})^{1/2}} \exp\left(-\frac{(\mathbf{x} - \boldsymbol{\mu})^\top \boldsymbol{\Sigma}^{-1}(\mathbf{x} - \boldsymbol{\mu})}{2}\right).$$

Properties of multivariate normal distributions.

1. Any linear combination of  $X_1, \dots, X_m$  is normally distributed.
2. The marginal distribution of each random variable is normal.
3. If the covariance of  $X_1$  and  $X_2$  is 0, then  $X_1$  and  $X_2$  are independent. The reverse is true.
4. If  $X_1$  and  $X_2$  are normally distributed with the joint density of  $f(x_1, x_2)$ , then the marginal expectation of  $X_1$  given  $X_2$  is a linear function of  $X_2$ :  $\mathbb{E}[X_1|X_2 = x_2] = a + bx_2$ .

## References

- ▶ The **chi-squared distribution** is the distribution of the sum of  $m$  squared independent standard normal distributed variables.
- ▶ Let  $\mathbf{Z} \sim N(0, \mathbf{I}_m)$  be multivariate standard normal, then  $\mathbf{Z}^\top \mathbf{Z} \sim \chi_m^2$ .
- ▶ If  $\mathbf{X} \sim N(0, \Sigma)$  with  $\Sigma$  positive definite, then  $\mathbf{X}^\top \Sigma^{-1} \mathbf{X} \sim \chi_m^2$ .
- ▶ Let  $Q_m \sim \chi_m^2$  and  $Q_r \sim \chi_r^2$  be independent. Then  $\frac{Q_m/m}{Q_r/r} \sim F_{m,r}$ .
- ▶ Let  $Z \sim N(0, 1)$  and  $Q_m \sim \chi_m^2$  be independent, then  $\frac{Z}{\sqrt{Q_m/m}}$  follows the  $t$ -distribution with  $m$  degree of freedom,  $t_m$ .

Almost all the statistical and econometric procedures used in this text involve averages or weighted averages of a sample of data.

- ▶ Characterizing the distributions of sample averages.
- ▶ The act of random sampling is a random variable, its distribution is **sampling distribution**.

# Sampling II

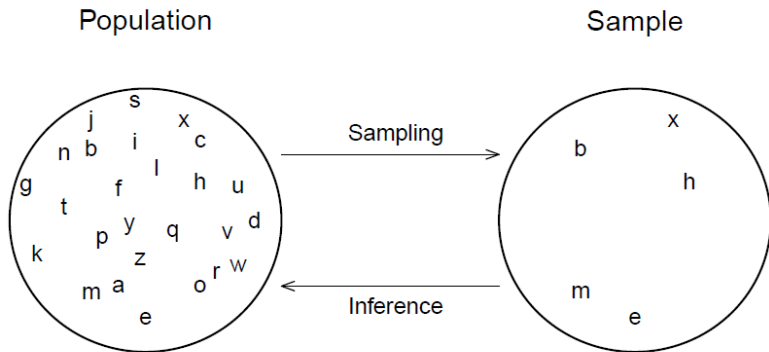

1. **Simple random sampling.** e.g. A commuting student record daily traffic time.
2. **i.i.d. draws.** e.g.  $Y_1, \dots, Y_n$  are randomly drawn from the same population.

## Definition 8 (independent and identically distributed(i.i.d))

The collection of random vectors  $\{X_1, \dots, X_n\}$  are **independent and identically distributed(i.i.d)** if they are mutually independent with identical marginal distributions.

- ▶ A collection of random vectors  $\{X_1, \dots, X_n\}$  is a **random sample** from the population  $F$  if  $X_i$  are i.i.d with distribution  $F$ .
- ▶ The distribution  $F$  is called the **population distribution**. We refer to the distribution as the **data generating process(DGP)**.
- ▶ The **sample size**  $n$  is the number of individuals in the sample.

Figure: Sampling and Inference

There are two approaches to characterizing sampling distributions:

1. **the exact approach** derives: the **exact distribution** or **finite-sample distribution** of  $Y$ .
2. **the approximate approach** uses approximations to the sampling distribution that rely on the sample size being large, often called the asymptotic distribution.

Two useful tools when the sample size is large: **the law of large numbers** and the **central limit theorem**.

- ▷ The law of large numbers says that when the sample size is large,  $\bar{Y}$  will be close to  $\mu_Y$  with very high probability.
- ▷ The central limit theorem says that when the sample size is large, the sampling distribution of the standardized sample average,  $(\bar{Y} - \mu_Y)/\sigma_{\bar{Y}}$ , is approximately normal.

- ▶ The sample average,  $\bar{Y}$ , varies from one randomly chosen sample to the next and thus is a random variable with a sampling distribution. If  $Y_1, \dots, Y_n$  are i.i.d., then
- ▶ the sampling distribution of  $Y$  has mean  $\mu_Y$  and variance  $\sigma_{\bar{Y}}^2 = \sigma_Y^2/n$ .
- ▶ the law of large numbers says that  $\bar{Y}$  converges in probability to  $\mu_Y$ ; and
- ▶ the central limit theorem says that the standardized version of  $\bar{Y}$ ,  $(\bar{Y} - \mu_Y)/\sigma_{\bar{Y}}$ , has a standard normal distribution  $N(0, 1)$  distribution. when  $n$  is large.

- ▷ A sequence of random variables  $Z_n \in \mathbb{R}$  **converges in probability** to  $c$  as  $n \rightarrow \infty$ , denoted by  $Z_n \rightarrow_p c$  or  $\text{plim}_{n \rightarrow \infty} Z_n = c$ , if for all  $\delta > 0$ ,

$$\lim_{n \rightarrow \infty} \mathbb{P}(|Z_n - c| \leq \delta) = 1.$$

## Theorem 9 (Weak Law of Large Numbers(WLLN))

If  $X_i$  are i.i.d. and  $\mathbb{E}(X) < \infty$ , then as  $n \rightarrow \infty$ ,

$$\bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i \rightarrow_p \mathbb{E}(X).$$

An estimator  $\hat{\theta}$  of a parameter  $\theta$  is **consistent** if  $\hat{\theta} \rightarrow_p \theta$  as  $n \rightarrow \infty$ .

# Continuous Mapping Theorem

## Theorem 10 (Continuous Mapping Theorem)

*If  $Z_n \rightarrow_p c$  as  $n \rightarrow \infty$  and  $h(\cdot)$  is continuous at  $c$  then  $h(Z_n) \rightarrow_p h(c)$  as  $n \rightarrow \infty$ .*

## Central Limit Theorem I

## Theorem 11 (Central Limit Theorem(CLT))

If  $X_j$  are i.i.d. and  $\mathbb{E}(X^2) < \infty$  then as  $n \rightarrow \infty$

$$\sqrt{n}(\bar{X}_n - \mu) \rightarrow_d N(0, \sigma^2),$$

where  $\mu = \mathbb{E}(X)$  and  $\sigma^2 = \mathbb{E}[(X - \mu)^2]$ .

## Slutsky's Theorem I

## Theorem 12 (Slutsky's Theorem)

If  $Z_n \rightarrow_d Z$  and  $c_n \rightarrow_p c$  as  $n \rightarrow \infty$ , then

1.  $Z_n + c_n \rightarrow_d Z + c$
2.  $Z_n c_n \rightarrow_d Z c$
3.  $\frac{Z_n}{c_n} \rightarrow_d \frac{Z}{c}$  if  $c \neq 0$ .

Suppose you want to understand the distribution of  $X$  in the population.

- ▷ When a statistic  $\hat{\theta} = \hat{\theta}(X_1, \dots, X_n)$  is a function of an i.i.d. sample, then the distribution is determined by the population distribution is  $F$  and the sample size is  $n$ .
- ▷ We call the distribution of  $\hat{\theta}$  the **sample distribution**.

The goal of an estimator  $\hat{\theta}$  is to learn about the parameter  $\theta$ , we evaluate the

- ▷ The exact bias and variance.
- ▷ The distribution under normality.
- ▷ The asymptotic distribution as  $n \rightarrow \infty$ .

## References

The p-value is the area in the tails of the distribution of  $\bar{Y}$  under the null hypothesis beyond  $\mu_{Y,0} \pm |\bar{Y}^{act} - \mu_{Y,0}|$ .

- ▶ To compute the p-value, need to know the shape of the distribution.
- ▶ With CLT, the sampling distribution of  $\bar{Y}$  is well approximated by a normal distribution

When  $\sigma_Y$  is known, then we can compute the p-value

- ▶ Recall: By CLT,  $(\bar{Y} - \mu_Y)/\sqrt{\sigma_{\bar{Y}}} \rightarrow_d N(0, 1)$ , then  $\sqrt{n}(\bar{Y} - \mu_Y) \rightarrow_d N(0, \sigma_Y^2)$ .
- ▶ Under the null hypothesis,
 
$$p\text{-value} = Pr\left(\left|\frac{\bar{Y} - \mu_{Y,0}}{\sigma_{\bar{Y}}}\right| > \left|\frac{\bar{Y}^{act} - \mu_{Y,0}}{\sigma_{\bar{Y}}}\right|\right) = 2\Phi\left(-\left|\frac{\bar{Y}^{act} - \mu_{Y,0}}{\sigma_{\bar{Y}}}\right|\right),$$
- ▶ where  $\Phi$  is the standard normal cumulative distribution function.

Issue:  $\sigma_{\bar{X}}$  **unknown**.

If the following assumptions hold:

1.  $X_1, \dots, X_n$  are i.i.d.
2.  $\mathbb{E}(X_i) < \infty$ .

The sample variance is computed

$$\bar{s}^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2.$$

- ▷  $\mu$  is unknown, need to be estimated.
- ▷  $\mathbb{E}((X - \bar{X})^2) \rightarrow \frac{n-1}{n} \sigma$ .
- ▷ The sample variance is a consistent estimator of the population variance.

- ▷ The parameter of interest is  $\theta = \mu_1 - \mu_2$ .
- ▷ Let  $\bar{W}_1$  and  $\bar{W}_2$  be the estimated sample mean and  $s_1^2$  and  $s_2^2$  be the estimated sample variance for group 1 and group 2.
- ▷ The standard error of  $\hat{\theta} = \bar{W}_1 - \bar{W}_2$  is  $se(\hat{\theta}) = \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$ .
- ▷ We construct the t-statistic as  $t = \frac{\hat{\theta} - d_0}{se(\hat{\theta})}$ .
- ▷ We reject  $H_0$  if  $t > Z_{1-\alpha}$ .

# Social Class or Education? Childhood Circumstances and Adult Earning I

This example is based on the example in SW2020 Chapter 3, p.p. 122.

**TABLE 3.1** Differences in Household Income According to Childhood Socioeconomic Circumstances, Grouped by Level of Highest Qualification

Qualification	Father's NS-SEC = Higher			Father's NS-SEC = Routine			Difference, Higher vs. Routine			
	$Y_h$	$s_h$	$n_h$	$Y_r$	$s_r$	$n_r$	$Y_h - Y_r$	$SE(Y_h - Y_r)$	95% Confidence Interval for $d$

- ▷ breaks down the differences in mean household income for individuals according to their are father's NS-SEC occupation type,
- ▷ and considers these differences for selected highest level of educational qualification
- ▷ The data shows that within both groups according to the NS-SEC of a father's occupation, those with higher qualifications are part of households with higher total income.
- ▷ Test the differences between mean income by the father's occupational categorization ( $Y_h - Y_r$ ) for each of the educational groupings.

## References

Consider the t-statistic used to test the hypothesis  $H_0 : \mu_Y = \mu_{Y,0}$ , using data  $Y_1, \dots, Y_n$ .

$$t = \frac{\bar{Y} - \mu_{Y,0}}{\sqrt{s_Y^2/n}},$$

where  $s_Y^2$  is the estimated sample mean.

- ▶ When  $n$  is larger, under general conditions the t-statistic has a standard normal distribution if the sample size is large and the null hypothesis is true.
- ▶ When  $n$  is small, then the t-statistic in Equation has a Student t distribution with  $n - 1$  degrees of freedom.

## References

To illustrate a test for the difference between two means

- ▶ let  $\mu_w$  be the mean hourly earnings in the population of women recently graduated from college,
- ▶ let  $\mu_m$  be the population mean for recently graduated men.
- ▶ Consider the null hypothesis that mean earnings for these two populations differ by a certain amount, say,  $d_0$ . Then the null hypothesis and the two-sided alternative hypothesis are  $H_0 : \mu_m - \mu_w = d_0$  vs.  $H_1 : \mu_m - \mu_w \neq d_0$

## References

## Population means are unknown:

- ▶ must be estimated from samples of men and women.
- ▶ Suppose we have samples of  $n_m$  men and  $n_w$  women drawn at random from their populations.
- ▶ Let the sample average annual earnings be  $\bar{Y}_m$  for men and  $\bar{Y}_w$  for women.
- ▶ An estimator of  $\mu_m - \mu_w$  is  $\bar{Y}_m - \bar{Y}_w$ .

In asymptotics:

- ▶  $\bar{Y}_m \rightarrow_d N(\mu_m, \sigma_m^2/n_m)$ ,  $\bar{Y}_w \rightarrow_d N(\mu, \sigma_w^2/n_w)$
- ▶ By properties of random distributions,  
 $\bar{Y}_m - \bar{Y}_w \rightarrow N(\mu_m - \mu_w, (\sigma_m^2/n_m) + (\sigma_w^2/n_w)^2)$ .

## Example IV

Construct t-statistics:

$$t = \frac{\bar{Y}_m - \bar{Y}_w}{\sqrt{(\sigma_m^2/n_m) + (\sigma_w^2/n_w)}}.$$

- ▶ When  $n$  is larger ( $> 30$ ),  $t \rightarrow_d N(0, 1)$ .
  - ◊ If the test is at 5% significance level, reject if  $t > 1.64$ .
- ▶ When  $n$  is small ( $\leq 30$ ),  $t \sim t - \text{dist}_{n-1}$

This table can be used to calculate  $\Pr(Z \leq z)$  where  $Z$  is a standard normal variable. For example, when  $z = 1.17$ , this probability is 0.8791, which is the table entry for the row labeled 1.1 and the column labeled 7.
